

ADARSH BHARDWAJ

Fullstack + AI Engineer · Agent Systems, Retrieval & LLM Infrastructure

Patna, India · adarshbhardwaj9182@gmail.com · adarshbhardwaj.space

github.com/Adarsh-9182 · linkedin.com/in/adarsh-bhardwaj-925b31263 · x.com/adarshdevs

SUMMARY

Fullstack and AI engineer building agent systems for domains where a wrong answer costs money or health. I ship LLM products on a strict separation of concerns: deterministic, tested code decides every number and every safety verdict; the model routes, explains and never gets a vote on the result. Founder of Paisa (AI CFO / AI-native ERP) and NutriScan AI (clinical-safety health agent); 270+ tests across shipped systems.

EXPERIENCE

Founder & AI Engineer — Paisa

Jul 2026 – Present

AI CFO and AI-native ERP — askpaisaai.com

- Built a double-entry accounting engine where balances are projections over an **append-only journal**, with a hard architectural rule that the model never computes a number.
- Designed a **grounding verifier** that checks every figure in an answer against the tool outputs of that turn — untraceable numbers are rejected and rewritten, or the answer is not sent.
- Shipped ASC 606 revenue recognition, multi-entity consolidation, Indian GST and filing deadlines, and a close process that runs executable checks instead of tickable boxes.
- Integrated Stripe with a connector that refuses non-INR charges rather than silently converting at an unspecified rate. **237 tests** behind the system.
- Own the full stack end to end: agent architecture, secure bank integrations, financial modules, backend and deploy pipeline. Present the product to mentors and investors.

Stack: TypeScript · Node · Anthropic API · PostgreSQL · Vitest · Vercel

AI Engineer (Internship) — MCPfy.ai

Aug 2026

- Designed the company marketing site — visual design through to the shipped front end.
- Built and integrated the MCP-based developer tooling and APIs that customer agent workflows ran on; debugged reliability issues and tested the integrations other teams depended on.
- Shipped **MCPfy Inspector**, a tool to connect to a running MCP server, inspect the tools it actually exposes, call them and read the responses — surfacing schema/handler mismatches instead of leaving them to be inferred from odd agent behaviour.

Stack: TypeScript · Next.js · Model Context Protocol · Tailwind · REST APIs · Vercel

Founder & AI Engineer — NutriScan AI

2026 – Present

AI health agent with a clinical safety layer — nutritiscan.com

- Built a **supervisor-specialist agent architecture** that routes each question to the agent that owns it, with each specialist scoped to only the slice of the patient record it needs.
- Implemented a deterministic triage layer that runs **before** the model reasons, fails closed on error and can end the turn outright: a model may raise suspicion, but nothing it says can lower a rule-derived verdict.
- Delivered the product across web and mobile, with food-image and nutrition analysis as one input signal rather than the product itself.

Stack: TypeScript · Next.js · React · React Native · Anthropic API · Supabase · Tailwind · Vitest

Founder — Zylo

2026 – Present

E-commerce platform — zylo-delta.vercel.app

- Built a real storefront end to end: schema and migrations, server/client boundary, API routes and deploy — **194 products** in PostgreSQL behind Drizzle with search, faceted filters, product pages and a cart that survives a refresh.
- Marked the catalogue module server-only so the build fails the moment a client component reaches for the database; all 194 product pages still prerender at build time, now from the database.
- Modelled reviews as a first-class table rather than JSON on the product, so a customer-written review points back at the customer. Next: accounts, server-side cart and checkout with real orders.

Stack: TypeScript · Next.js · React · PostgreSQL · Drizzle · Framer Motion · Tailwind · Vercel

Collaborator — RateMyFace

2026

- Working with Lakshay Arora on ratemyface.in — a face-scoring app that reads a photo against golden-ratio proportions and returns a score with the underlying measurements. Own the TypeScript side: scoring flow, product surface and delivery plumbing.

Open Source Contributor — AI/ML & developer tooling

Ongoing

- Features, bug fixes, documentation and performance work across agent frameworks and developer tooling — mostly Python and JavaScript. Active on GitHub, Hugging Face and LangChain-adjacent projects.

SELECTED OPEN-SOURCE PROJECTS

agent-framework — Grounded agent library extracted from Paisa

2026

- Generalised Paisa's grounding machinery into a library: a tool registry that keeps each function beside the schema the model reads, an orchestrator that routes and records every invocation, and a verifier that rejects any answer stating a figure no tool returned.
- Writing it standalone paid for itself immediately — the first test caught that the original searched tool output as a single string, so a stray "INR 26" counted as grounded by a balance of "INR 32,42,600". A wrong number verified as correct; the fix went back into Paisa. **22 tests**.

Stack: TypeScript · Anthropic API · Vitest

cited-retrieval — Reproducible retrieval for high-stakes corpora

2026

- Retrieval for corpora where being wrong is expensive and being unreproducible is unacceptable — tax provisions, filings, contract terms. Every passage carries its source and last-verified date, because a correct answer drawn from a stale document is still wrong.
- Field-weighted scoring with BM25 tie-breaking, deliberately not embeddings: for a curated corpus of hundreds of passages, identical results per query — inspectable and pinnable in CI — beat the recall gain. **12 tests**, zero dependencies.

Stack: TypeScript · BM25 · Vitest

TECHNICAL SKILLS

Languages Python, TypeScript, JavaScript, Java, C++, SQL

AI & LLM Anthropic API, OpenAI API, LangChain, Model Context Protocol, prompt design, tool calling, structured output

Agents & RAG Multi-agent orchestration, intent routing, retrieval pipelines, vector search, embeddings, text-to-SQL, grounded generation, fail-closed escalation

ML PyTorch, TensorFlow, scikit-learn, NumPy, Pandas, Streamlit

Backend FastAPI, Django, Node.js, Express, REST, GraphQL, WebSockets

Frontend React, Next.js, React Native, Expo, Tailwind

Data PostgreSQL, MongoDB, Redis, DynamoDB, Supabase, Drizzle, vector databases

Infra AWS, GCP, Lambda, Docker, Kubernetes, GitHub Actions, Jenkins, CI/CD, Vercel

Practice Git, testing (Vitest), monitoring, code review, Agile, Jira

EDUCATION & BACKGROUND

B.A. English (Honours) — IGNOU, distance learning

2024 – 2027

B.Tech — Lovely Professional University (left to build full time)

Aug 2025 – Apr 2026

Also: Coursework in solutions architecture, AI/ML and agentic AI. Appeared in JEE Advanced. Presented Paisa to mentors, investors and peers.
